

In today's CC, first download this posts dataset file from [this link](#). Understand the structure of the JSON data and create a REST API for the same.

Refer to this image for route patterns.

GET	https://mysite.com/api/users
GET	https://mysite.com/api/users/1
POST	https://mysite.com/api/users
PUT	https://mysite.com/api/users/1
DELETE	https://mysite.com/api/users/1

Use Insomnia or Postman to test out requests other than GET.

Note:

- If you are not able to actually delete and update in the list, its fine. **Do focus on the patterns of the route itself**, and respond back with dummy success messages.

Let me know if you have any doubts in **#ask_instructor** channel.
