

In today's CC, (after creating account in cloudinary), create the following routes allowing user to use fileupload feature.

GET /upload

This route should show a form which allows user to upload an image.

GET /gallery

This route should show an image gallery with all the images the user has uploaded.

Note:

- Apart from the above routes, you are free to add any more routes which might be necessary.
- You can store the url returned from the cloudinary in a json file using the fs module in Node.js
